

# More Exercise: Associative Arrays

Problems for exercise and homework for the ["C# Fundamentals" course @ SoftUni](#)

You can check your solutions in [Judge](#)

## 1. Ranking

Here comes the final and the most interesting part – the Final ranking of the candidate-interns. The final ranking is determined by the points of the interview tasks and from the exams in SoftUni. Here is your final task. You will receive some lines of input in the format `"{contest}:{password for contest}"`, until you receive `"end of contests"`. Save that data, because **you will need it later**. After that, you will receive another type of input in the format `"{contest}=>{password}=>{username}=>{points}"` until you receive `"end of submissions"`. Here is what you need to do:

- Check if the **contest is valid** (if you received it in the first type of input).
- Check if the **password is correct for the given contest**.
- Save the user with the contest they take part in (**a user can take part in many contests**) and the points the user has in the given contest. If you receive the **same contest and the same user**, **update the points, only if the new ones are more than the older ones**.

In the end, you have to print the info for the user with the **most points** in the format `"Best candidate is {user} with total {total points} points."`. After that print **all students ordered by their names**. For each user print each contest with the points in descending order. See the examples.

### Input

- Strings in format `"{contest}:{password for contest}"` until the `"end of contests"` command. There will be no case with two equal contests.
- Strings in format `"{contest}=>{password}=>{username}=>{points}"`, until the `"end of submissions"` command.
- There will be no case with 2 or more users with the same total points!

### Output

- On the first line, print the best user in format `"Best candidate is {user} with total {total points} points."`.
- Then print all students, ordered as mentioned above, in format:

```
"{user1 name}"
```

```
"# {contest1} -> {points}"
```

```
"# {contest2} -> {points}"
```

### Constraints

- The strings may contain any ASCII character except `':', '=', '>'`.
- The numbers will be in range `[0...10000]`.
- Second input is always valid.

### Examples

Input	Output
Part One Interview:success Js Fundamentals:Jsfundmpass C# Fundamentals:fundPass Algorithms:fun end of contests C# Fundamentals=>fundPass=>Tanya=>350 Algorithms=>fun=>Tanya=>380 Part One Interview=>success=>Nikola=>120 Java Basics Exam=>jsfundmpass=>Mary=>400 Part One Interview=>success=>Tanya=>220 OOP Advanced=>password123=>Jim=>231 C# Fundamentals=>fundPass=>Tanya=>250 C# Fundamentals=>fundPass=>Nikola=>200 Js Fundamentals=>Jsfundmpass=>Tanya=>400 end of submissions	Best candidate is Tanya with total 1350 points. Ranking: Nikola # C# Fundamentals -> 200 # Part One Interview -> 120 Tanya # Js Fundamentals -> 400 # Algorithms -> 380 # C# Fundamentals -> 350 # Part One Interview -> 220
Java Advanced:funpass Part Two Interview:success Math Concept:asdasd Java Web Basics:forrF end of contests Math Concept=>ispass=>Mona=>290 Java Advanced=>funpass=>Simon=>400 Part Two Interview=>success=>Derek=>120 Java Advanced=>funpass=>Peter=>90 Java Web Basics=>forrF=>Simon=>280 Part Two Interview=>success=>Peter=>0 Math Concept=>asdasd=>Derek=>250 Part Two Interview=>success=>Simon=>200 end of submissions	Best candidate is Simon with total 880 points. Ranking: Derek # Math Concept -> 250 # Part Two Interview -> 120 Peter # Java Advanced -> 90 # Part Two Interview -> 0 Simon # Java Advanced -> 400 # Java Web Basics -> 280 # Part Two Interview -> 200

## 2. Judge

You know the judge system, right? Your job is to create a program similar to the Judge system.

You will receive **several input lines** in one of the following formats:

"{username} -> {contest} -> {points}"

The **contestName** and **username** are strings, the given **points** will be an integer number. You need to keep track of **every contest** and **individual statistics of every user**. You should **check if such a contest already exists** and if not, add it, otherwise, **check if the current user is participating in the contest**. If they are participating, **take the higher score**, otherwise, just **add it**.

Also, you need to keep **individual statistics** for each **user** - the **total points of all contests**.

You should end your program when you receive the command "**no more time**". At that point, you should print each contest in **order of input**, for each contest print the participants **ordered by points in descending order**, then **ordered by name in ascending order**. After that, you should print **individual statistics for every participant**, ordered by **total points in descending order**, and **then by alphabetical order**.

## Input / Constraints

- The input comes in the form of commands in one of the formats specified above.
- Username and contest name **always will be one word**.
- Points will be an integer in the **range [0...1000]**.

- There will be **no invalid** input lines.
- If **all sorting criteria fail**, the order should be by **order of input**.
- The input ends when you receive the command "**no more time**".

## Output

- The output format for the contests is:  
`"{contestName}: {participants.Count} participants"`  
`"{position}. {username} <::> {points}"`
- After you print all contests, print the **individual statistics for every participant**.
- The output format is:

`"Individual standings:"`

`"{position}. {username} -> {totalPoints}"`

## Examples

Input	Output
Peter -> Algo -> 400 George -> Algo -> 300 Sam -> Algo -> 200 Peter -> DS -> 150 Maria -> DS -> 600 no more time	Algo: 3 participants 1. Peter <::> 400 2. George <::> 300 3. Sam <::> 200 DS: 2 participants 1. Maria <::> 600 2. Peter <::> 150 Individual standings: 1. Maria -> 600 2. Peter -> 550 3. George -> 300 4. Sam -> 200
Peter -> OOP -> 350 George -> OOP -> 250 Sam -> Advanced -> 600 George -> OOP -> 300 John -> OOP -> 300 John -> Advanced -> 250 Anna -> JSCore -> 400 no more time	OOP: 3 participants 1. Peter <::> 350 2. George <::> 300 3. John <::> 300 Advanced: 2 participants 1. Sam <::> 600 2. John <::> 250 JSCore: 1 participants 1. Anna <::> 400 Individual standings: 1. Sam -> 600

	2. John -> 550
	3. Anna -> 400
	4. Peter -> 350
	5. George -> 300

### 3. MOBA Challenger

Peter is a pro-MOBA player, he is struggling to become a master of the Challenger tier. So he watches carefully the statistics in the tier.

You will receive **several input lines** in one of the following formats:

"{player} -> {position} -> {skill}"

"{player} vs {player}"

The **player** and **position** are strings, the given **skill** will be an integer number. You need to keep track of **every player**.

When you receive a **player and their position and skill**, add them to the player pool, if they aren't present, **else add** their position and skill **or update** their skill, only if the current position skill is lower than the new value.

If you receive "{player} vs {player}" and **both players exist** in the tier, **they duel** with the following rules:

Compare their positions, **if they have at least one in common**, the player with better **total skill points** wins and the other is **demoted** from the tier -> remove him/her. If they have the same total skill points, **the duel is a tie** and they both continue in the season.

If they don't have positions in common, **the duel isn't happening** and both continue in the Season.

You should end your program when you receive the command "**Season end**". At that point, you should print the players, **ordered by total skill in descending order, then ordered by player name in ascending order**. **Foreach** player print their position and skill, **ordered descending by skill, then ordered by position name in ascending order**.

### Input / Constraints

- The input comes in the form of commands in one of the formats specified above.
- Player and position **will always be one-word string, containing no whitespaces**.
- Skill will be an **integer** in the **range [0...1000]**.
- There will be **no invalid** input lines.
- The program ends when you receive the command "**Season end**".

### Output

- The output format for each player is:  
 "{player}: {totalSkill} skill"  
 "- {position} <::> {skill}"

### Examples

Input	Output	Comments
-------	--------	----------

Peter -> Adc -> 400 George -> Jungle -> 300 Sam -> Mid -> 200 Sam -> Support -> 250 Season end	Sam: 450 skill - Support <::> 250 - Mid <::> 200 Peter: 400 skill - Adc <::> 400 George: 300 skill - Jungle <::> 300	We order the players by total skill points descending, then by name. We print every position along its skill ordered descending by skill, then by position name.
Peter -> Adc -> 400 Bush -> Tank -> 150 Faker -> Mid -> 200 Faker -> Support -> 250 Faker -> Tank -> 250 Peter vs Faker Faker vs Bush Faker vs Hide Season end	Faker: 700 skill - Support <::> 250 - Tank <::> 250 - Mid <::> 200 Peter: 400 skill - Adc <::> 400	Faker and Peter don't have a common position, so the duel isn't valid.  Faker wins vs Bush /common position: "Tank". Bush is demoted.  Hide doesn't exist so the duel isn't valid.  We print every player left in the tier.

## 4. Snowwhite

Snow White loves her dwarfs, but there are so many and she doesn't know how to order them. Does she order them by name? Or by the color of their hat? Or by physics? She can't decide, so it's up to you to write a program that does it for her.

You will be receiving **several input lines** which contain **data** about **dwarfs** in the following format:

"{dwarfName} <:> {dwarfHatColor} <:> {dwarfPhysics}"

The **dwarfName** and the **dwarfHatColor** are **strings**. The **dwarfPhysics** is an **integer**.

You must **store** the **dwarfs** in your program. There are several rules though:

- If **2 dwarfs** have the **same name** but **different colors**, they should be **considered different dwarfs**, and you should store **both** of them.
- If **2 dwarfs** have the **same name** and the **same color**, store the **one** with the **higher physics**.

When you receive the command "**Once upon a time**", the input ends. You must **order** the **dwarfs** by **physics** in **descending order** and then by the **total count** of **dwarfs** with the **same hat color** in **descending order**.

Then you must print them all.

### Input

- The input will consist of **several input lines**, containing **dwarf data** in the format, specified above.
- The input **ends** when you receive the command "**Once upon a time**".

### Output

- As output, you must print the **dwarfs**, **ordered** in the way, specified above.
- The output format is: "{(hatColor)} {name} <-> {physics}"

## Constraints

- The **dwarfName** will be a **string** that may contain **any ASCII** character except ' ' (space), '<', ':', '>'.
- The **dwarfHatColor** will be a **string** that may contain **any ASCII** character except ' ' (space), '<', ':', '>'.
- The **dwarfPhysics** will be an **integer** in the range  $[0... 2^{31} - 1]$ .
- There will be **no invalid** input lines.
- If **all sorting criteria fail**, the order should be by **order of input**.
- Allowed working **time / memory**: 100ms / 16MB.

## Examples

Input	Output
Peter <:> Red <:> 2000 Tony <:> Blue <:> 1000 George <:> Green <:> 1000 Sam <:> Yellow <:> 4500 John <:> Black <:> 1000 Once upon a time	(Yellow) Sam <-> 4500 (Red) Peter <-> 2000 (Blue) Tony <-> 1000 (Green) George <-> 1000 (Black) John <-> 1000
Peter <:> Red <:> 5000 Peter <:> Blue <:> 10000 Peter <:> Red <:> 10000 George <:> Blue <:> 10000 Once upon a time	(Blue) Peter <-> 10000 (Blue) George <-> 10000 (Red) Peter <-> 10000

## 5. Dragon Army

Heroes III is the best game ever. Everyone loves it and everyone plays it all the time. Stamat is no exclusion to this rule. His favorite units in the game are all **types** of dragons – black, red, gold, azure, etc. He likes them so much that he gives them **names** and keeps logs of their **stats**: **damage**, **health** and **armor**. The process of aggregating all the data is quite tedious, so he would like to have a program doing it. Since he is no programmer, it's your task to help him.

You need to categorize dragons by their **type**. For each dragon, identified by **name**, keep information about his **stats**. Type is **preserved** as in the order of input, but dragons are **sorted** alphabetically by name. For each type you should also print the average **damage**, **health** and **armor** of the dragons. For each dragon print his stats.

There **may** be **missing** stats in the input, though. If a stat is missing, you should assign its default values. Default values are as follows: health **250**, damage **45** and armor **10**. Missing stat will be marked by **null**.

The input is in the following format "{type} {name} {damage} {health} {armor}". Any of the integers may be assigned null value. See the examples below for better understanding of your task.

If the same dragon is added a second time, the new stats should **overwrite** the previous ones. Two dragons are considered **equal** if they match by **both** name and type.

## Input

- On the first line, you are given number N -> the number of dragons to follow.

- On the next N lines, you are given input in the above-described format. There will be a single space separating each element.

## Output

- Print the aggregated data on the console.
- For each type print average stats of its dragons in format "**{Type}::({damage}/{health}/{armor})**".
- Damage, health and armor should be rounded to two digits after the decimal separator.
- For each dragon, print its stats in format "**-{Name} -> damage: {damage}, health: {health}, armor: {armor}**".

## Constraints

- N is in the range [1...100].
- The dragon's type and name are each one word only, starting with a capital letter.
- Damage health and armor are integers in the range [0...100000] or **null**.

## Examples

Input	Output
5 Red Bazgargal 100 2500 25 Black Dargonax 200 3500 18 Red Obsidion 220 2200 35 Blue Kerizsa 60 2100 20 Blue Algordox 65 1800 50	Red::(160.00/2350.00/30.00) -Bazgargal -> damage: 100, health: 2500, armor: 25 -Obsidion -> damage: 220, health: 2200, armor: 35 Black::(200.00/3500.00/18.00) -Dargonax -> damage: 200, health: 3500, armor: 18 Blue::(62.50/1950.00/35.00) -Algordox -> damage: 65, health: 1800, armor: 50 -Kerizsa -> damage: 60, health: 2100, armor: 20
